

pH Electrode use

1. Remove storage bottle and open the ring so that you see the fill hole ("Ring" above).
2. Rinse the electrode with dH₂O before use and in between samples.
3. Dip the electrode into your solution but don't let it hit the bottle of the breaker or flask.
4. When done rinse with dH₂O and put the electrode back into the storage solution (see above).

If needed the pH meter manual is in the drawer below the pH meter.
